Data Flow Diagram

The **Data Flow Diagram (DFD)** illustrates the movement of data within the **Flood Prediction System using Machine Learning**. It shows how weather data is collected from users, processed through machine learning models, stored in the database, and transformed into flood risk predictions for disaster management authorities. The DFD helps visualize the interaction between external entities, system processes, and data storage.

DFD Symbol Legend

Symbol	Name	Description
Rectangle	External Entity	Represents users interacting with the system, such as Meteorologists and Disaster Management Authorities.
Rounded Rectangle / Process Box	Process	Represents system functions such as Data Collection, Machine Learning Prediction, and Result Generation
Open-Ended Rectangle (Data Store)	Data Store	Stores historical weather data, trained machine learning models, and prediction records.
Labeled arrow	Data Flow	Shows the movement of data between users, processes, and the database.
